Zouhair Maghzaoui — spatial clusters

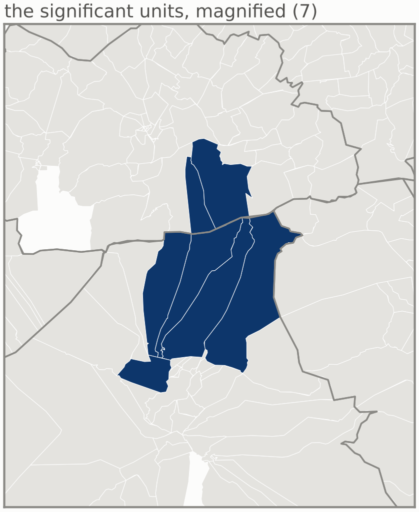
local Moran's I, imada level · Benjamini-Hochberg q = 0.05

LISA class

- high in a high neighbourhood — HH (7)
- low in a low neighbourhood — LL (0)
- high in a low neighbourhood — HL (0)
- not significant (2035)

2042 mapped units

the significant units, magnified (7)



global Moran's I = +0.399 (p < 0.0001, 9,999 permutations, pseudo z = +31.5). The map localises that: a class is assigned only where the unit's own neighbourhood is more extreme than 9,999 random neighbourhoods drawn from the same values, after Benjamini-Hochberg correction across all 2,042 units (threshold actually applied: p ≤ 0.0001). Uncorrected, 324 units reach p ≤ 0.05 — which is what an uncorrected LISA map would shade, and at 2,042 tests about 102 of those are expected by chance alone. Empirical-Bayes standardising the rate, so a small unit's noisy share is not read as geography, reclassifies 0 unit(s).
