

Spatial clusters of each candidate's share — delegation level

high in a high neighbourhood (HH) low in a low neighbourhood (LL) high in a low neighbourhood (HL) not significant low in a high neighbourhood (LH)

Kais Saied

I = +0.555 · 8 of 264 significant

Ayachi Zammel

I = +0.552 · 9 of 264 significant

Zouhair Maghzaoui

I = +0.375 · 6 of 264 significant

Local Moran's I against 9,999 conditional permutations, Benjamini-Hochberg q = 0.05 across all 264 units. Classes are per candidate, so the same shade in two panels means the same relationship to that candidate's own mean, not the same share. Clusters this small are specks at national scale by their nature — the per-candidate figures magnify each of them.
Saied's low-among-low cluster and Zammel's high-among-high cluster nest: Saied's 8 are a strict subset of Zammel's 9, which adds Omrane Supérieur — the arithmetic of a 91% result, where Saied's weakness is mechanically his rival's strength.
