

Kais Saied's first-round share, 15 September 2019: what a model can and cannot recover

the grey band is the national mean: a model with nothing to say sits on it, not on the diagonal

Forward-selected OLS, three variables, the selection redone inside every fold. Candidate predictors: the 2014 presidential and legislative results by constituency, 2014 participation, geography, and the 2014 census aggregated from delegation to governorate. Every number is out of sample. Sources: ISIE 2019 retrospective report annex 7, JORT 2014, INS RGPH 2014 via MedDhia/rgph2014tn, OCHA/HDX COD-AB boundaries. Built by tools/make_model_figure.py; the evaluation, including the permutation test behind these numbers, is tools/model_saied_2019.py.
