

Turnout, weighted by electorate

Dorling cartogram · circle area is registered voters · 259 delegations

Circle area is the registered electorate on the turnout basis, so the ink is proportional to the people whose participation is being measured -- unlike the choropleth, where the ten largest delegations cover 40.6% of the map. Positions are approximate: circles are nudged apart until none overlap, a median 0.2% of the map diagonal from where they belong.

SCALE FITTED TO THIS MAP: the ramp spans 13.8% to 44.8%, about 3.2 times the contrast of the fixed version; a shade means nothing elsewhere, and maps/turnout/turnout_cartogram.* is the comparable one. The national rate of 30.38% is ruled across the bar. Delegations below the coverage floor are absent entirely rather than drawn at zero.

The registered count is the only field in this dataset that no identity on the form checks — the one field read by classifier alone — so turnout is a certified numerator over an uncertified denominator, and is weaker evidence than any candidate figure mapped elsewhere in this directory.
